Title : Problem of control of salt deposit in steam turbines
Periodical : Energ. byul., #8, 9-11, Ag 1954
Abstract : Special arrangement for testing salinity of steam before admission to the turbine is described. Control of the salinity of the boiler water is made with reference to the test of steam sample passing through the H-cation and anion filters and measuring tank.

Title : Study of the effect of separator devices on the quality of steam in high pressure boilers

Periodical : Energ. byul., #7, 14-18, J1 1954

Abstract : Various arrangements for the separation of contaminated feed water and steam in the high pressure boiler drum are described. The study is conducted by boilers with and without separator baffles. Contamination by salt and silicic acid is reduced about three times. 3 drawings and 1 table.

Institution : None

Title : Method of cleaning high pressure steam turbine.

Periodical : Izv. V.T.I., 21, No. 1, 22-23, Ja 1952

Abstract : Method of cleaning high pressure steam turbine from silicate deposits (non-soluble in water) is described. Caustic soda of different alkalinity is admitted to the steam inlet pipe together with feed water. Diagramatic arrangement of the cleaning system and the results of cleaning are presented in two tables.

Institution : Feed Water Laboratory. All Union Heat Engineering Inst. im. F. E. Dzerzhinsky (VTI).

USSR:

Silicic acid carried by high-pressure steam. A. A. Kozlov, *Tr. Stantsii* 22, No. 12, 24-6(1951). The silicic acid carried mechanically by high-pressure steam is directly proportional to silica in the boiler water and varies with the steam pressure. At 120-atm. steam pressure, the SiO_2 in the steam is 0.28 mg./kg. from boiler water contg. 85 mg./kg. SiO_2 and 0.08 mg./kg. from water contg. 30 mg./kg. The corresponding figures for 100-atm. steam pressure are 0.27 at 85, and 0.12 at 30; for 80-atm. steam pressure, 0.26 at 85, and 0.12 at 30; and for 70-atm. steam pressure, 0.26 at 85, 0.06 at 30; and for 70-atm. steam pressure, 0.26 at 85. The Na_2SiO_3 , Na_2PO_3 , Na_2SO_3 , NaCl , Na_2CO_3 , SiO_2 , R_2O_3 , CaO , SO_2 , and P_2O_5 contents are given of deposits on the blades of a turbine operating at 80, 90, 65, and 70 atm. V. H. Gottschalk

"Formation of Silicic Acid Compounds on Steam Turbine Blades," A. A. Kot, Cand Tech Sci

"Elek Stants" No 7, pp 19-20

Experiments show that, to eliminate formation of insoluble silicic acid compounds on high-pressure turbine blades, it is necessary to maintain excess of hydrated alkalinity in boiler water of such quantity that molarity ratio of Na_2O to SiO_2 is not less than 1. Editor notes experimental results are not sufficiently conclusive to permit their application to industry.

Coagulation of strongly turbid river waters. A. A. Kot.
V. A. Ponomarev, V. P. Ugol'nikov. *Elek. Mashin.* 20.
No. 11, 51-53 (1949). Clogging of cationite filters through
scale consisting mainly of natrolite, $\text{Na}_2\text{O} \cdot \text{Al}_2\text{O}_3 \cdot 3\text{SiO}_2 \cdot$
 $2\text{H}_2\text{O}$, is prevented by coagulation of suspended matter
with $\text{FeSO}_4 \cdot 7\text{H}_2\text{O}$ or $\text{Al}_2(\text{SO}_4)_3 \cdot 18\text{H}_2\text{O}$. With 200 mg/l

of the former, water with originally 380-760 mg/l dry
residue, pH 7.4-8.0, became completely transparent, with
 SiO_2 falling from 39 to 4.6-8.5, oxidability from 85 to
25-30 mg/l. Adequate results are also obtained with
70-200 mg/l $\text{Al}_2(\text{SO}_4)_3 \cdot 18\text{H}_2\text{O}$, at pH 6-7. N. Thon
